

NICE SOLUTIONS FOR TRUNKED RADIO RECORDING

NICE Trunked Radio Recording Solutions are the new global standard for police, fire and rescue, border control, transportation authorities, ambulance — and more. NICE Trunked Radio Recording Solutions, in combination with the most sophisticated market-leading trunked radio providers, are the most robust available for capturing, managing, and replaying vital transmissions.

Insight from Interactions

NICE

Global Standard

It's not hard to see why trunked radio has become the new standard for mobile and transport communications with public safety, transportation and other civil and commercial users — trunked radio maximizes use of scarce radio bandwidth and expensive infrastructure, privacy and dependability are greatly enhanced, and all users have more flexibility.

But the advanced switching technology that makes trunked radio so compelling has also presented a challenge to the sophisticated recording necessary for instant verification, mission critical reliability and resilience, legally admissible records and accurate incident reconstructions.

With the NICE Trunked Radio Recording Solutions, nothing is missed. NICE solutions are superior at capturing all traffic on the network, including all groups, all telephone interconnects, all system events, all IDs, all zones or areas, and all sites. Accurate and comprehensive recording is not only practical but cost effective too. Now, NICE Trunked Radio Recording is the only solution you and your users can really depend on.

Optimal Interface

The secret behind NICE Systems' new Trunked Radio Recording Solutions is how they integrate. While other recording systems make do with "reverse-engineered" interfaces with incomplete links that only provide partial information, NICE Trunked Radio Recording Solutions go directly to the core of the network through a variety of optimized interface options. These critical integrations are the result of our strategic partnerships with Motorola® and M/A-COM.

This controlled access to all networked speech traffic and routing information provides the powerful recording, search, reconstruction, and scenario replay tools to choose what is recorded instead of forcing you to work within arbitrary limits. Every transmission can be tagged with key data extracted from the network, giving you much more flexibility and control over message retrieval and management so that staff can locate messages quickly and easily — based on time of day, date, channel, type of call, radio ID, group ID and a host of other search criteria. They can even see exactly who was in contact with who, and when, and they can recreate all of the radio and telephone communications around complex incidents, providing invaluable evidential or compliance information.

No matter what type of trunked radio solution you have now, or what upgrades you may implement in the future, NICE Systems has the ideal interface. And as the recording vendor of choice for industry leaders like Motorola® and M/A-COM, you can rest assured that your NICE Systems Trunked Radio Recording Solutions will incorporate the latest radio system changes and upgrades, to ensure your solutions remain optimal.

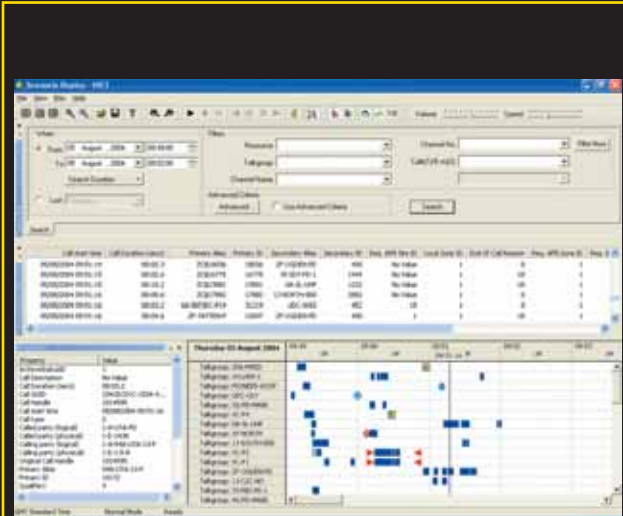

Trunked Radio Recording Components

NICE Trunked Radio Recording uses the industry's most comprehensive family of software applications for the location, retrieval and playback of recorded information.

- NICE Call Logging Server (NiceCLS) — Stores all the transmission and event data vital to recovering messages and recreating, in real time, the environment in which they took place.
- Scenario Replay — A fully featured search and replay application to access telephone and radio information from the NiceCLS using a simple graphical interface available on any network workstation to rapidly pinpoint and replay messages. For more detailed work, such as training and assisting in post-event enquiries, Scenario Replay provides virtual event reconstruction right on the desktop, locating and arranging messages in accurate sequence, and playing them back exactly as they happened.
- Multiple criteria let users build complex search routines, displaying the results in an easy-to-understand timeline format arranged by radio, channel or group. From this, operators can select single or multiple messages, replaying them all in context.
- Extensive system management, resilience, and user interface options — Paired with NICE Trunked Radio Recording Solution applications, these options provide virtually unlimited online network storage, high capacity archive, and fault-tolerant options, so you can be confident that your data is always secure.

The NICE Systems Edge

Trunked radio users working in safety-critical fields deserve the very best from their suppliers. NICE Systems' unique range of solutions gives us the edge in setting the industry benchmark for trunked radio recording, retrieval and playback, and with our strong global reputation for service and customer satisfaction, you can be confident that Nice Systems always delivers the very best.

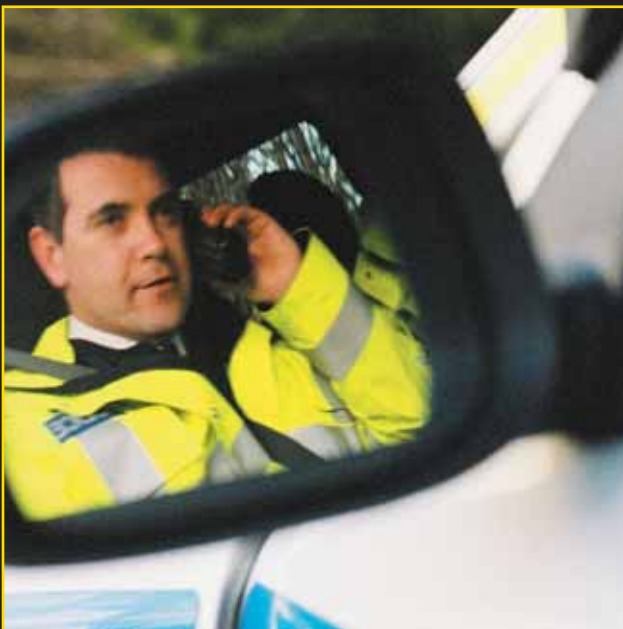

Scenario Replay

Not all trunked radio systems or configurations are alike:

There are numerous variations within trunking network families and even more configuration options. For this reason, NICE provides a much more sophisticated solution than a single, one-size-fits-all product.

For example, NICE Trunked Radio Recording captures audio on the exclusive NiceLog voice recorder. This state-of-the-art high-density recording platform offers up to 480 channels of recording and numerous options to protect your data, simplify your operations and make your logging system even more efficient.

As a trunked radio market leader, Nice Systems provides the broadest portfolio of direct trunked radio interfaces available — anywhere. This means that we can meet all your requirements both now and in the future as you grow and adapt.

NICE Systems' Public and Security Division deploys solutions for the network-based capture, storage and replay of all types of communications media, including voice, video, fax, email and web over fixed, mobile and IP networks. NICE's proven technological solutions enable First Responders to rapidly identify, analyze, and distribute key communications records. A wide range of video and audio content analysis and replay tools provide government and private agencies with proactive protection of critical assets. And state, local, and federal law enforcement officials can use NICE's lawful intercept technology to isolate, record, and analyze all communications from suspected criminals.

NICE Systems is the global provider of advanced solutions that enable organizations to extract the value hidden within multimedia interactions. NICE solutions sharpen the awareness of organizations to help them generate insight from interactions for improved decision-making, better performance and enhanced security. NICE has more than 15,000 customers in over 100 countries, including the world's top ten banks and over 65% of the Fortune 100. More information is available at www.nice.com.
